

Reflection

One concept that I learned in cell biology that helped me with course work is the mechanism of DNA Replication. Enzymes like helicase, DNA polymerase, and ligase working together to copy genetic DNA helped me with my genetics class. Some of the topics from each class were connected and helped me understand different aspects. Cell Biology has enhanced my knowledge of certain organelles, especially mitochondria. My new knowledge will certainly help understand how medications are processed in the body once I'm in pharmacy school.
