

**Describe the top three careers of social science graduates that you would be interested in considering. What attracts you to those jobs? Respond to one other student's entry**

Social sciences is a broad field with endless categories, sub-categories and individual roles that are always changing and evolving as new discoveries are made. A social sciences degree can be divided into a vast number of specializations with a few examples being anthropology, criminology, history, geography, political science, psychology, sociology and economics. I gained an interest in three different roles under the psychology specialization: a workforce insights analyst, a business development consultant, and a team development manager. The roles I have chosen all have similar characteristics with an emphasis on the application of psychological principles to improve efficiency of individual workers and teams in an organization. What attracted me to these roles was the opportunity to analyze the level to which these psychological variables impact an organization's performance and how these principles can be used to improve workplace collaboration and efficiency.
