

In the video, Tony Perez gave a briefing on the dangers of AI, advice for business cybersecurity plans, and how people are the most impactful component in any cybersecurity defense plan. The points that interested me in the video were the dangers of AI voice identification technology and the dangers of having uninformed lawmakers. Tony Perez explained that through the use of AI, a voice could be replicated in a matter of seconds, completely bypassing security and gaining access to the user's account. This use of AI is dangerous due to the possibility of deepfakes being created and impersonation. Even today, through the use of deepfake technology, anybody can create realistic videos that can be challenging to identify. Additionally, Tony Perez stressed the importance of having lawmakers informed on the impact of cybercriminals. Without informed lawmakers or professional assistance, law implementation can be delayed, and poor regulations may be introduced.
