

In the video, the cybersecurity expert gave a great explanation and clear examples of the dangers that come with using Bluetooth technology and connecting to unknown Wi-Fi connections. As mentioned in the video, most users will connect to a Wi-Fi network at an airport or coffee shop, for example, without much concern over their data being stolen. However, due to the lack of encryption and password security in these public networks or hotspots, data can be easily stolen in a matter of seconds. The vulnerabilities of a Bluetooth connection were also displayed by the expert remotely enabling a Bluetooth device without the user's knowledge. This creates serious worries of potential hackers listening in on conversations through devices that are utilized by users daily.
