Continued Learning

100 of 300 hours

Reflective Journal #2

During my second 50 hours on the job, I continued to learn and become more comfortable with daily tasks. My primary responsibility was to stay engaged and ask questions when needed. This approach helped me stay focused on absorbing new information.

One of my main objectives during these 50 hours was improving the skills I had developed during my first 50 hours. I became more confident in recalling frequently used Linux commands, such as `pwd`, `vi`, and `ls -l`, which I used regularly. I was also becoming more efficient in executing these commands without hesitation. My confidence grew as I applied these commands in real-world scenarios, which reinforced my learning and helped me adapt to the workflow.

Like my first 50 hours, one of the key challenges I faced was retaining the large amount of information I was exposed to. To overcome this, I relied heavily on the notes I had taken and consistently referred back to them. Whenever I encountered gaps in my understanding, I wasn't afraid to ask for clarification or further guidance. By the end of this period, I was able to manage more tasks independently, needing less supervision than before.

In conclusion, these 50 hours were essential for building my confidence and improving my technical skills, especially in Linux. My notetaking proved invaluable, and I learned the importance of asking questions when necessary. As I move forward, I expect to continue growing in my role, increasing my independence, and deepening my technical understanding.
